

PAREMPI

Particle emission prevention and impact:
from real-world emissions of traffic to
secondary PM of urban air

The global transportation sector is a major polluter and especially harmful are the fine particulate matter (PM_{2.5}) emissions.

PAREMPI has the potential to significantly contribute to meeting these challenges Europe faces today to make its transportation system

| Clean | Secure | Efficient

Join us on this journey!

The main goal of PAREMPI is to produce scientific evidence and knowledge, develop digital tools and recommend policies targeting all transport modes to reduce ambient fine particulate matter, PM2.5 and other emissions.

Exposure to high levels of these fine particles cause premature deaths and significant harm to human life and global ecosystems.
